Claim 22 (Canceled).

Claim 23 (Canceled).

Claim 24 (Canceled).

25. (New) A process of converting an insulated glass unit to an impact resistant insulated glass unit,

wherein an insulated glass unit comprises:

two sheets at least one of which is glass;

a space between said two sheets; and

a spacer, which separates and supports said at least two sheets and forms said space between said two sheets, which space is defined by inner surfaces of said two sheets

wherein the process comprises:

providing an insulated glass unit;

accessing said space and providing a liquid resin formulation on an inner surface, of said at least one sheet of glass,

wherein a layer of said resin, which is liquid prior to cure, is cured and renders said at least one sheet of glass impact resistant; and producing an impact resistant insulated glass unit.

26. (New) The process of Claim 25, wherein said at least one sheet of glass is tempered or heat strengthened glass.

27. (New) The process of Claim 25, wherein the resin is selected from the group consisting of polyurethane, polyester and acrylic resins.

28. (New) The process of Claim 27, wherein the polyester is a flexible low shrink polyester resin system which is formed from a reactant selected from the group consisting of phthalic anhydride, maleic anhydride, isophthalic anhydride, and terephthalic anhydride.

29. (New) The process of Claim 28, wherein the polyester is a flexible, low shrink polyester resin formed from a reactant selected from the group consisting of glycols, propylene glycol, ethylene glycol, dipropylene glycol, diethylene glycol, neopentylene glycol and products based on glycerin or trimethanol propane.

30. (New) The process of Claim 25, wherein the polyester is a low shrink polyester resin formed from a reagent selected from the group consisting of monomers, styrene, substituted styrenes, methyl methacrylic acid, dilute and multi-functional acrylates.

31. (New) The process of Claim 25, wherein the resin is a flexible acrylate resin based on polyacrylic polymers and acrylic monomers.

32. (New) The process of Claim 25, wherein the liquid resin formulation is provided on said inner surface of said at least one sheet of glass, which is maintained in a horizontal position.

33. (New) The process of Claim 32, wherein no resin is applied to a second inner surface.

34. (New) The process of Claim 25, wherein a second sheet is a second sheet of glass.

35. (New) The process of Claim 25, wherein the resin is formed with at least one component selected from the group consisting of polyols; tetrahydrofuran polymer diols; propoxylated glycols; triol; polyester glycols based on difunctional carboxylic acids and aliphatic glycols.

36. (New) The process of Claim 25, wherein the resin is formed with at least one component selected from the group consisting of polyols; tetrahydrofuran polymer diols;

propoxylated glycols; triol; polyester glycols based on difunctional carboxylic acids and aliphatic glycols.

37. (New) A process for retro-fitting existing insulated windows to convert them into impact resistant insulated glass units, comprising:

removing an insulated glass unit from a building;
wherein said insulated glass structure comprises:
at least two sheets or lamina, wherein at least one of said sheets or lamina is of glass;
a spacer, which separates and supports said at least two sheets of glass, and forms
an enclosed space between said two sheets;
accessing said space for providing a liquid resin formulation on an inner surface of
said at least one sheet of glass;
wherein the resin is liquid prior to cure;
curing said resin; and
producing an impact resistant insulated glass unit.

38. (New) The process of Claim 37, wherein the sheets of the insulated glass unit are maintained in a horizontal position, while providing said liquid resin formulation.

39. (New) The process of Claim 37, which further comprises installing said impact resistant insulated glass unit in a building.

40. (New) The process of Claim 37, wherein said at least one sheet of glass is tempered or heat strengthened glass.

41. (New) The process of Claim 37, wherein the resin is selected from the group consisting of polyurethane, polyester and acrylic resins.

42. (New) The process of Claim 37, wherein the polyester is a flexible low shrink polyester resin system which is formed from a reactant selected from the group consisting of phthalic anhydride, maleic anhydride, isophthalic anhydride, and terephthalic anhydride.

43. (New) The process of Claim 37, wherein the polyester is a flexible, low shrink polyester resin formed from a reactant selected from the group consisting of glycols, propylene glycol, ethylene glycol, dipropylene glycol, diethylene glycol, neopentylene glycol and products based on glycerin or trimethanol propane.

44. (New) The process of Claim 37, wherein the polyester is a low shrink polyester resin formed from a reagent selected from the group consisting of monomers, styrene, substituted styrenes, methyl methacrylic acid, dilute and multi-functional acrylates.

45. (New) The process of Claim 37, wherein the resin is a flexible acrylate resins based on polyacrylic polymers and acrylic monomers.

46. (New) The process of Claim 37, wherein the liquid resin formulation is pumped into the space which is in a horizontal position.

47. (New) The process of Claim 37, wherein said pumping is undertaken and no resin is applied to a second inner surface.

48. (New) The process of Claim 37, wherein a second sheet is a second sheet of glass.

49. (New) The process of Claim 37, wherein the resin is formed with at least one component selected from the group consisting of polyols; tetrahydrofuran polymer diols; propoxylated glycols; triol; polyester glycols based on difunctional carboxylic acids and aliphatic glycols.

50. (New) The process of Claim 37, wherein the resin is formed with at least one component selected from the group consisting of polyols; tetrahydrofuran polymer diols; propoxylated glycols; triol; polyester glycols based on difunctional carboxylic acids and aliphatic glycols.
